

Title

Foldable Table with Longitudinal Mid-Support Arrangement

Background of the Present Invention

Field of Invention

5 The present invention relates to a banquet table, and more particularly to a foldable table which comprises a longitudinal mid-support arrangement extended between two side runners for substantially enhancing the strength of the tabletop and the leg assembly in a foldably movable manner.

Description of Related Arts

10 Banquet tables have become very popular since the tables are economy, cheap and foldable that can be quickly and easily folded for carriage and storage and unfolded for use. Especially when some participant-intensive activities take place in multi-function rooms or designated areas, the banquet tables can be temporary set up in minutes. After the functions, the banquet tables can be quickly and neatly folded up for
15 storage.

 A conventional banquet table comprises a tabletop and a pair of table legs foldable mounted underneath the tabletop. For example, U.S. patent 5,957,061 generally suggests a banquet table that two table legs are pivotally mounted at two opposed side end portions of the tabletop. Since the two table legs support the tabletop at two side end
20 portions thereof, when a downward loading force F is applied on the tabletop, a mid-portion of the tabletop may be cracked easily. In order to enhance the rigid structure of the banquet table, the tabletop must be made of stiffness material such as wood or metal. However, the wooden or metal tabletop will increase the overall weight of the banquet table that reduces the portability of the banquet table.

25 In order to enhance the portability of the banquet table, the tabletop is made of lightweight material such as plastic. One of the common technologies to manufacture the

tabletop is known as the plastic "air-blow" molding technique. Therefore, the overall weight of the banquet table will be substantially reduced by the plastic tabletop. However, such banquet table having the plastic tabletop has several drawbacks.

5 The strength of such plastic tabletop is weak that the mid-portion of the plastic tabletop may be cracked easily due to the downward loading force F. As shown in Figs. 1 and 2, U.S. patent 6,431,092 generally suggests a banquet table generally comprises a plastic made top panel 1, two metal made supporting arms 2 longitudinally mounted under the top panel 1, and a metal made reinforcing arm 3 transversely mounted below a mid-portion of the top panel 1 between the two supporting arms 2 to substantially
10 increase the strength of the top panel 1.

In addition, in order to foldably attach the table leg 4 to the tabletop, the table leg 4 comprises a standing leg rotatably mounted between the supporting arms 2 and a folding leg pivotally mounted between the standing leg and the reinforcing arm 3 such that the standing leg is capable of pivotally folding under the top panel 1 of the tabletop.
15 As a result, the reinforcing arm 3 not only enhances the strength of the top panel 1 but also rigidly supports the table leg 4 in a foldable manner. In other words, the plastic tabletop must include the reinforcing arm 3 in order to form the banquet table.

However, the reinforcing arm 3 restricts the pivotally attaching position of the folding leg. Since the reinforcing arm 3 is transversely mounted at the middle of the tabletop, the folding leg must be long enough to pivotally extend from the standing leg to
20 the reinforcing arm 3, which may weaken the strength of the folding leg.

Furthermore, due to the position of the reinforcing arm 3, the tabletop cannot be modified to employ with a folding hinge at the mid-portion thereof for further overlappedly folding the tabletop in half to substantially reduce the size of the tabletop.

25 Summary of the Present Invention

A main object of the present invention is to provide a foldable table, which comprises a mid-runner longitudinally extended between two side runners for

substantially enhancing the strength of the tabletop and the leg assembly in a foldably movable manner.

Another object of the present invention is to provide a foldable table, which has a rigid, simple, and strong structure to evenly distribute and support a downward loading
5 force on the tabletop to the leg assembly through the mid-runner.

Another object of the present invention is to provide a foldable table, wherein a folding frame of the leg assembly is adapted to adjustably couple along the mid-runner to retain the leg assembly in a folded position. In other words, a length of the folding frame can be substantially shortened to couple between the standing leg and the mid-runner so
10 as to enhance the strength of the leg assembly.

Another object of the present invention is to provide a foldable table, wherein the mid-runner provides a substantial support without altering or complicating the original structure of the foldable table.

Another object of the present invention is to provide a foldable table, wherein
15 the mid-runner can be simply modified to incorporate with a folding hinge to overlappedly fold the tabletop so as to substantially reduce the size thereof.

Another object of the present invention is to provide a foldable table, wherein no expensive or mechanical structure is required to employ in the present invention in order to achieve the above mentioned objects. Therefore, the present invention
20 successfully provides an economic and efficient solution not only for providing a reinforced supporting configuration to the tabletop but also for enhancing the folding movement of the leg assembly with respect to the tabletop.

Accordingly, in order to accomplish the above objects, the present invention provides a foldable table, comprising:

25 a tabletop having two longitudinal side edge portions;

two side runners respectively supported at the two side edge portions of the tabletop;

a longitudinal mid-support arrangement comprising a mid-runner longitudinally extended between the two side runners to support the tabletop; and

5 a pair of leg assemblies foldably and spacedly affixing to the tabletop, wherein each of the leg assemblies comprises a leg frame transversely and pivotally mounted between the two side runners and a folding frame pivotally coupling between the leg
frame and the mid-runner to retain the leg frame in an unfolded position, in such a manner that in a folded position, the leg frames are pivotally and inwardly folded to rest under the tabletop, and in the unfolded position, the leg frames are pivotally and outwardly folded to perpendicularly stand under the tabletop such that the longitudinal
10 mid-support arrangement is adapted for evenly distributing and supporting a downward loading force on the tabletop to the leg assemblies through the mid-runner.

These and other objectives, features, and advantages of the present invention will become apparent from the following detailed description, the accompanying drawings, and the appended claims.

Brief Description of the Drawings

Fig. 2 is a sectional view of the conventional foldable table, illustrating the downward loading force applying on the tabletop of the conventional foldable table.

- 5 Fig. 3 is a perspective view of a foldable table according to a preferred embodiment of the present invention.

Fig. 4 is an exploded perspective view of an attachment unit of the foldable table according to the above preferred embodiment of the present invention.

- 10 Fig. 5 is a sectional view of the foldable table according to the above preferred embodiment of the present invention, illustrating the downward loading force applying on the tabletop of the foldable table.

Fig. 6 illustrates the foldable table incorporating with a folding hinge according to the above preferred embodiment of the present invention.

Detailed Description of the Preferred Embodiment

Referring to Fig. 3 of the drawings, a foldable table according to a preferred embodiment of the present invention is illustrated, wherein the foldable table comprises a plastic tabletop 10 having two longitudinal side edge portions 11, two side runners 20 respectively supported at the two side edge portions 11 of the tabletop 10, and
5 longitudinal mid-support arrangement comprising a mid-runner 30 extended between the two side runners 20 to support the tabletop 10.

The foldable table further comprises a pair of leg assemblies 40 foldably and spacedly affixing to the tabletop 10, wherein each of the leg assemblies 40 comprises a
10 leg frame 41 transversely and pivotally mounted between the two side runners 20 and a folding frame 42 pivotally coupling between the leg frame 41 and the mid-runner 30 to retain the leg frame 41 in an unfolded position. In which, in a folded position, the leg frames 41 are pivotally and inwardly folded to rest under the tabletop 10, and in the
15 unfolded position, the leg frames 41 are pivotally and outwardly folded to perpendicularly stand under the tabletop 10 such that the longitudinal mid-support arrangement is adapted for evenly distributing and supporting a downward loading force F on the tabletop 10 to the leg assemblies 40 through the mid-runner 30.

According to the preferred embodiment, the tabletop 10 is a single layer tabletop preferably made of lightweight but rigid material, such as plastic, by plastic
20 molding or FRP. It is worth to mention that the tabletop 10 can be a double-layer tabletop that a top layer is overlapped on a bottom layer to define an air chamber therebetween.

The tabletop 10, having a rectangular shaped, defines a surrounding rim 12 downwardly extended from each of the side edge portions 11 of the tabletop 10 to define
25 a receiving cavity 101 within the surrounding rim 12 at a bottom side of the tabletop 10 such that each of the foldable pivot leg assemblies 40 is adapted to foldably receive within the receiving cavity 101 of the tabletop 10 at the folded position.

As shown in Fig. 3, the surrounding rim 12 has an outer sidewall 121 and an inner sidewall 122 to define a receiving track 123 longitudinally formed under the

tabletop 10 along the respective side edge portion 11 thereof wherein the two side runners 20 are securely mounted within the receiving tracks 123 respectively.

Each of the side runners 20, which is made of rigid material such as metal, is an elongated member extended from one side end portion of the tabletop 10 to another
5 opposed side end portion thereof at a longitudinal mid-portion of the tabletop 10, so as to substantially enhance the rigid structure of the tabletop 10.

As shown in Fig. 3, the mid-runner 30 is extended between the two side runners 20 in a parallel manner at a position underneath the tabletop 10 for further enhance the rigid structure of the tabletop 10 at a longitudinal mid-portion thereof, wherein the mid-
10 runner 30 is substantially extended between the two leg assemblies 40 so as to reinforce the two leg assemblies 40.

According to the preferred embodiment, each of the leg frames 41 comprises a transverse member 411 rotatably extended between the two side runners 20 and a supporting leg 412 downwardly extended from the transverse member 411 in such a
15 manner that each of the two supporting legs 412 is adapted to pivotally fold between the folded position and the unfolded position. Accordingly, each of the transverse members 411 has two ends rotatably engaged with the two side runners 20 respectively wherein the two transverse members 411 are transversely extended along two transverse side edge portions of the tabletop 10 respectively so as to enhance the strength of the tabletop 10.

Each of the folding frames 42 has a leg coupling end 421 pivotally coupling
20 with the respective leg frame 41 and a table coupling end 422 pivotally and selectively coupling along the mid-runner 30 such that when the leg frames 41 are outwardly and pivotally folded, each of the folding frames 42 limits a pivot movement of the respective leg frame 41 with respect to the mid-runner 30 so as to retain the respective leg frame 41
25 at the unfolded position.

Each of the folding frames 42 comprises a folding brace 423 defining the leg coupling end 421 to pivotally connect to supporting leg 421 of the leg frame 41 and a folding arm 424 which is pivotally connected to the folding brace 423 and defines the table coupling end 422 to pivotally connect to the mid-runner 30 such that when the leg
30 frames 41 are inwardly and pivotally folded to the folded position, the folding braces 423 are pivotally folded to overlap with the folding arms 424 respectively. In other words,

the folding brace 423 is pivotally folded with respect to the folding arm 424 to extend a distance between the leg coupling end 421 of the folding frame 42 and the table coupling end 422 thereof so as to retain the respective leg frame 41 at the unfolded position.

It is worth to mention that the table coupling end 422 of the respective folding frame 42 can be adjustably coupled with the mid-runner 30 at any position between the two transverse members 411 of the leg frames 41 depending on the length of the tabletop 10 such that the tabletop 10 can rigidly support a greater downward loading force F thereon in comparison with the conventional foldable table since the mid-runner 30 of the longitudinal mid-support arrangement not only substantially supports the tabletop 10 but also evenly distributes the downward loading force F to the leg assemblies 40, as shown in Fig. 5. In other words, each of the folding frames 42 does not need to pivotally extend from the respective leg frame 41 to a mid-portion of the tabletop 10 so as to substantially enhance the rigid configuration of the folding frame 42.

As shown in Fig. 4, the mid-runner 30 has two ends 31 extended to respectively couple with the two leg frames 41 and enables the leg frames 41 to rotate with respect to the mid-runner 30. Accordingly, the foldable table further comprises two attachment units 50 rotatably connecting the leg frames 41 with the two ends 31 of the mid-runner 30 respectively wherein each of the attachment units 50 comprises a C-shaped frame holder 51 having a guiding slot 511 for the respective transverse member 411 rotatably passing through and a frame connector 52 extended from the frame holder 51 to securely attach to the respective end 31 of the mid-runner 30 via a rivet or a screw in such a manner that the transverse members 411 of the leg frames 41 are rotatably connected to the ends 31 of the mid-runner 30.

It is apparent that the attachment unit 50 can be replaced by other connecting arrangements which connect the respective end 31 of the mid-runner 30 with the transverse member 411 of the respective leg frame 41 such that the transverse member 411 is allowed to support under the tabletop 10 in a rotatably movable manner with respect to the mid-runner 30.

It is worth to mention that two or more mid-runners 30 can be employed to parallelly extend between the two side runners 20 wherein the table coupling end 422 of the folding frame 42 is adapted for pivotally coupling with the two mid-runners 30 to guide the leg frame 41 to fold between the folded position and the unfolded position.

Preferably, the mid-runner 30 is supported underneath the tabletop 10 by connecting the two ends 31 of the mid-runner 30 to the transverse members 411 of the leg frame 41 respectively so as to retain the mid-runner 30 in position. Therefore, the downward loading force F applied on the tabletop 10 can be evenly distributed and supported to the entire leg assemblies 40, i.e. the leg frames 41 and the folding frames 42, through the mid-runner 30 of the longitudinal mid-support arrangement.

In other words, the foldable table of the present invention, as shown in Fig. 5, has a rigid, simple, and strong structure to evenly distribute and support the downward loading force F on the tabletop 10 to the leg assemblies 40 through the mid-runner 30 in comparison with the conventional foldable table as shown in Fig. 2.

It is worth to mention that the mid-runner 30 is adapted to directly and securely mount underneath the tabletop 10 to retain the position of the mid-runner 30 wherein the ends 31 of the mid-runner 30 is extended towards the two leg frames 31 between the two side runners 20 such that no attachment unit 50 is required to connect the mid-runner 30 with the leg frames 41. However, the mid-runner 30 can still enhance the strength of the tabletop 10 and reinforce the leg assemblies 40.

As shown in Fig. 6, the foldable table according to the preferred embodiment can be further modified to further reduce the overall size thereof by overlappedly folding the tabletop 10 in half. Accordingly, the tabletop 10, which is constructed to have two side panels 101, comprises a pivot hinge 60 formed at a mid-portion of each of the side runners 20 between the two side panels 101, wherein the mid-runner 30 has two longitudinal portion pivotally connected end to end in such a manner that the side panels 101 are adapted to fold in an overlapped manner via the pivot hinge 60 to reduce the size of the tabletop 10. It is worth to mention that an additional pivot hinge can be employed to pivotally connect the longitudinal portions of the mid-runner 30 so as to enhance the folding movement of the tabletop 10.

Therefore, the foldable table of the present invention can be simply modified to incorporate with the pivot hinges 60 without altering or complicating the original structure of the foldable table in comparison with the conventional foldable table that the reinforcing arm is transversely extended at a mid-portion of the tabletop.

One skilled in the art will understand that the embodiment of the present invention as shown in the drawings and described above is exemplary only and not intended to be limiting.

5 It will thus be seen that the objects of the present invention have been fully and effectively accomplished. Its embodiments have been shown and described for the purposes of illustrating the functional and structural principles of the present invention and is subject to change without departure from such principles. Therefore, this invention includes all modifications encompassed within the spirit and scope of the following claims.
